Aviation Quality Manual - flightcompensationclaim.co.uk

Quality Control Quality is a " system standard " at Aviation Concepts, Inc. We are an audited and accredited member of the Aviation Suppliers Association and are in compliance with the FAA Advisory Circular 00-56 under the ASA-100 standard. All of our rotable spare parts carry an FAA 8130-3 or a EASA Form One.

AS9100, AS9110, and AS9120, the quality management system (QMS) standards for the aerospace industry, are written in the most ambiguous language possible. Indeed, they don t outline how they should be implemented. Those decisions are left to the organization implementing their requirements or, in some cases, to a consultant. Although some consultant firms for aerospace systems are excellent, there are many that purport to be experts yet proffer systems and processes that are either in contravention to the standards requirements or so unwieldy that they render the process impotent. In an effort to simplify these issues, this book proposes practices that have been described as opportunities for improvement or best practices by registration auditors in the past. It includes a discussion of each of the three standards clauses, suggests best practices to comply with them, outlines common findings associated with them, and provides an overview of the changes to AS9100C from AS9100B.

A vital resource for pilots, instructors, and students, from the most trusted source of aeronautic information.

Although aviation is among the safest modes of transportation in the world today, accidents still happen. In order to further reduce accidents and improve safety, proactive approaches must be adopted by the aviation community. The International Civil Aviation Organization (ICAO) has mandated that all of its member states implement Safety Management System (SMS) programs in their aviation industries. While some countries (the United States, Australia, Canada, members of the European Union and New Zealand, for example) have been engaged in SMS for a few years, it is still non-existent in many other countries. This unique and comprehensive book has been designed as a textbook for the student of aviation safety, and as an invaluable reference tool for the SMS practitioner in any segment of aviation. It discusses the quality management underpinnings of SMS, the four components, risk management, reliability engineering, SMS implementation, and the scientific rigor that must be designed into proactive safety. The authors introduce a hypothetical airline-oriented safety scenario at the beginning of the book and conclude it at the end, engaging the reader and adding interest to the text. To enhance the practical application of the material, the book also features numerous SMS in Practice commentaries by some of the most respected names in aviation safety. In this second edition of Safety Management Systems in Aviation, the authors have extensively updated relevant sections to reflect developments since the original book of 2008. New sections include: a brief history of FAA initiatives to establish SMS, data-driven safety studies, developing a system description, SMS in a flight school, and measuring SMS effectiveness.
