Topic 2 Atomic Structure – IB Chemistry  
Atoms contain a positively charged dense  
nucleus composed of protons and neutrons  
(nucleons). Negatively charged electrons  
occupy the space outside the nucleus. The  
main energy level or shell is given an integer  
number,  $n$ , and can hold a maximum  
number of electrons,  $2n^2$ . A more detailed  
model of the atom describes the.

We call this second type of orbital a 'p' orbital. Carbon holds no surprises and the expected value (6/5 times that of boron) is 1086 kJ mol<sup>-1</sup>. The slightly large value can be ascribed to 'shrinkage' once again.

Nitrogen also follows the pattern as its first ionisation energy is 1420 kJ mol<sup>-1</sup>.
